

# THE TECHNOLOGY VALUE STREAM

By Vincent Ryan

# THE VALUE STREAM

# THE VALUE STREAM

- The software development cycle brings value to the consumer.
- We increase value in this stream is to limit lead time and development time.

# THE COMMON SCENARIO

- In a traditional project at a large business, development takes can take weeks or even months.
- Long drawn out plans will be developed in a box until the product is finished and then released to the consumer.
- This can have varied results depending on the design of the project and how close it is to the end users needs.
- This process can be very long and expensive.

# THE DEVOPS IDEAL

- In DevOps perspective the goal should be to produce goods as quickly as possible.
- As written this goal is to get feedback and push successful product as quickly as possible.
- Short lead times, short development times with more iterative products to reach the consumer with a more satisfying end good.
